

SAAD UR REHMAN SYED

Kanagawa, Japan • saadirfan803@gmail.com • linkedin.com/in/saad-syed-169786214 • github.com/saadJP23

Software engineer who architected and delivered 4 production systems across e-commerce, AI/ML, SaaS, and real-time ordering domains. Experienced in full-cycle software delivery - from system design and database architecture to cloud deployment and production monitoring. Strong understanding of scalable architecture principles including caching, load balancing, and distributed systems. Bilingual in English and Japanese (JLPT N2).

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, SQL, Java, HTML5/CSS3

Frontend: React, Next.js, Tailwind CSS, Vite, REST API Design

Backend: Node.js, Express, Flask, JWT, WebSockets, MVC, Redis

Databases: MySQL, PostgreSQL, Supabase, Redis, Elasticsearch

Cloud & DevOps: AWS (EC2, Amplify, Lightsail), Docker Compose, Kubernetes, Helm, Nginx, Certbot, Vercel, Render, Railway, Git/GitHub, GitHub Actions

AI/ML: TensorFlow, PyTorch, scikit-learn, OpenAI API, CNNs, Transfer Learning

Payments & APIs: Stripe (Checkout, Webhooks, Signature Validation), Spoonacular API, Cloudinary

PRODUCTION SYSTEMS

Tabehub - QR Restaurant Ordering Platform

order.tabehub.xyz

Next.js • TypeScript • Supabase • Stripe • Tailwind CSS | Capstone - Team Lead

- Led a team of engineers to design and ship a QR-based mobile ordering platform targeting Japanese izakayas; guests browse menus, place orders, and complete Stripe-integrated payments entirely in-browser-reducing average order fulfillment time by ~45% versus paper-based workflows.
- Engineered real-time order state synchronization across 10+ concurrent table sessions using Supabase live subscriptions, cutting per-table staff intervention by ~50%; implemented JWT-secured account persistence and automated reservation management via Stripe webhooks.

ShopScout - Production E-commerce Platform

shopscout.org

React • Node.js • Express • MySQL • Stripe • AWS EC2 • Docker Compose • Nginx • Certbot | Independent

- Architected a full-stack e-commerce platform deployed on AWS EC2 with Nginx configured as a reverse proxy and load balancer, handling static asset caching and Gzip compression to reduce page load time by ~35%; designed with horizontal scaling in mind using Docker Compose for service isolation, with Certbot-managed HTTPS eliminating manual SSL renewal overhead.
- Achieved 100% Stripe webhook delivery reliability through verified event-signature validation, automatically syncing inventory and dispatching transactional email confirmations on each order; containerized the complete application stack with Docker Compose, cutting environment setup and deployment time by ~55%.

Chefly - AI-Powered Recipe Discovery Platform

chefly.com

Flask • Python • MySQL • TensorFlow • PyTorch • scikit-learn • OpenAI API • Cloudinary | Independent

- Designed a multi-modal AI cooking engine by fine-tuning MobileNetV2 and EfficientNetB0 CNNs on a custom image dataset via TensorFlow transfer-learning pipelines, achieving 92%+ food classification accuracy and reducing dish-identification latency by ~70% versus baseline text-only search.
- Unified three data sources, local MySQL, Spoonacular API, and an OpenAI fallback, into a single ranked query pipeline with graceful degradation, lifting successful query resolution to 98%+ and reducing average recipe search response time by ~65%.

NipponBid - Japanese Vehicle Auction Management Platform

nipponbid-psi.vercel.app

React 18 • Vite 5 • Node.js • Express • MySQL • Redis • Elasticsearch • Docker • Kubernetes | Independent

- Architected a full-stack SaaS procurement platform for Japanese car auction dealers; built an automated inventory sync pipeline that refreshes 1,400+ live auction listings twice daily and a real-time status lifecycle (pending → won → purchased → shipped → delivered) with per-dealer ledgers and B/L document management, reducing bid-to-purchase processing time by ~60%.
- Implemented JWT-based multi-user authentication with role-scoped access, a filterable admin analytics dashboard surfacing revenue, remittance, and receivables KPIs (cutting financial reporting time by ~75%), and a multi-provider deployment across Vercel, Render, and Railway at under \$5/month total infrastructure cost.

- Dockerized the platform and deployed it to Kubernetes via a custom Helm chart (StatefulSet MySQL primary/replica, HPA autoscaling), backed by a fully automated GitHub Actions CI/CD pipeline (build → GHCR → helm upgrade with auto-rollback); added Redis caching and Elasticsearch fuzzy search, cutting repeat-query latency to sub-millisecond.

EXPERIENCE

Common.inc - Web Developer Intern

Tokyo, Japan | Feb 2025 – May 2025

- Rebuilt and maintained client-facing web pages using WordPress, HTML5, CSS3, and JavaScript, standardizing component patterns across 15+ pages and reducing reported UI defects by ~40% within the first sprint cycle.
- Collaborated with UI/UX designers and PMs in a cross-functional agile team, tightening PR review cycles and shared component standards to accelerate feature delivery cadence by ~30%.

EDUCATION

Temple University Japan Campus

Bachelor of Science in Computer Science

Tokyo, Japan | Graduated May 2026

Languages: English (Advanced Professional) • Japanese (JLPT N2) • Urdu (Native)
